WHAT IS CLAIMED IS:

- 1 1. A method comprising:
- identifying portions of a model as being either critical to a
- real-time execution of the model or non-critical to a real-time
- 4 execution of the model; and
- generating code that is capable of real-time execution based
- on the critical portions of the model.
- 1 2. The method of claim 1 wherein non-critical portions are post-
- 2 processing units.
- 3. The method of claim 2 wherein post-processing units are
- logical units of the model that have no data outputs that feed
- 3 non-post-processing sections of the model.
- 1 4. The method of claim 1 wherein generating further comprises
- 2 establishing an inter-process communication link between the code
- and the non-critical portions of the model.
- 5. The method of claim 4 further comprising receiving output
- from the code via the inter-process communications link.
- 1 6. The method of claim 5 further comprising executing the code
- on a target processor.
- 7. The method of claim 5 further comprising processing the
- output in the non-critical portions of the model.
- 1 8. A computer program product residing on a computer readable
- medium having instructions stored thereon which, when executed by
- a processor, cause the processor to:

5

- identify portions of a model as being either critical to a real-time execution of the model or non-critical to a real-time execution of the model; and
- generate code that is capable of real-time execution based on the critical portions of the model.
- 9. A processor and a memory configured to:
- identify portions of a model as being either critical to a real-time execution of the model or non-critical to a real-time execution of the model, and
- generate code that is capable of real-time execution based on the critical portions of the model.
- 1 10. A method comprising:
 - specifying a model, the model including sections, a first subset of the sections designated post-processing unit sections and a second subset of the sections designated as core processing unit sections; and
 - generating software source code for the model with a code generator using the second subset.
- 1 11. The method of claim 10 wherein the post-processing unit 2 sections are logical units of the model that have no data outputs 3 that feed core processing unit sections.
- 1 12. The method of claim 10 further comprising:
- linking the code to the first subset of sections through an inter-process communication link; and
- executing the code on a target processor.
- 1 13. The method of claim 10 wherein specifying the model comprises receiving a user input through a graphical user interface (GUI).

- 1 14. The method of claim 10 wherein generating comprises applying
- a set of software instructions resident in the code generator to
- 3 the second subset.
- 1 15. The method of claim 12 further comprising:
- receiving output from the code via the inter-process
- 3 communications link; and
- 4 processing the output in the first subset.
- 1 16. A system comprising a graphical user interface (GUI) adapted
- to receive user inputs to specify components of a model, the
- 3 components containing a first subset of sections designated as
- 4 post-processing elements of a model and a second subset of
- sections designated as core elements of the model.
 - 17. The system of claim 16 further comprising an automatic code
 - generator to generate code capable of real-time execution based on
 - the second subset of the sections.
- 1 18. The system of claim 17 wherein the second subset includes
- elements representing essential computational components of the
- 3 model.
- 1 19. The system of claim 16 further comprising a link to provide
- inter-process communication between the code and the first subset
- of sections of the model.
- 20. The system of claim 19 wherein the first subset is non-real
- time post-processing sections.
- 1 21. The system of claim 16 wherein the automatic code generator
- 2 comprises a set of pre-defined instructions resident in the
- automatic code generator to generate code corresponding to the
- 4 second subset.

7

- 1 22. The system of claim 21 wherein the code is C programming
- 2 language.
- 1 23. The system of claim 16 further comprising a compiler for
- compiling the code for a target processor.
- 1 24. A method comprising:
- receiving user input through a graphical user interface (GUI)
- 3 specifying a block diagram model, the block diagram model
- 4 including sections, a first subset of the sections designated
- 5 post-processing unit sections and a second subset of the section
- designated as core processing unit sections;
 - generating software source code for the block diagram model with a code generator using the second subset;
 - linking the software source code to the first subset via an inter-process communication link; and
 - compiling the software source code into executable code.
 - 25. The method of claim 24 further comprising executing the executable code on a target processor.
- 1 26. A computer program product residing on a computer readable
- $_{\rm 2}$ $\,$ medium having instructions stored thereon which, when executed by
- the processor, cause the processor to:
- specify a model, the model including sections, a first subset
- of the sections designated post-processing unit sections and a
- second subset of the section designated as core processing unit
- 7 sections; and
- generate software source code for the model with a code
- generator using the second subset.
- 1 27. The computer program product of claim 26 wherein the computer
- readable medium is a random access memory (RAM).

- 1 28. The computer program product of claim 26 wherein the computer
- 2 readable medium is read only memory (ROM).
- 29. The computer program product of claim 26 wherein the computer
- 2 readable medium is hard disk drive.
- 30. A processor and a memory configured to:
- specify a block diagram model, the block diagram model
- 3 including data having internal pre-defined data storage classes
- and external custom data storage classes; and
- generate software source code for the block diagram model
- 6 with a code generator using the internal predefined data storage
- 7 classes and the external custom data storage classes.
- 1 31. The processor and memory of claim 30 wherein the processor
- and the memory are incorporated into a personal computer.
- 1 32. The processor and memory of claim 30 wherein the processor
- and the memory are incorporated into a network server residing in
- 3 the Internet.
- 1 33. The processor and memory of claim 30 wherein the processor
- and the memory are incorporated into a single board computer.
- 34. A computer program product residing on a computer readable
- medium having instructions stored thereon which, when executed by
- the processor, cause the processor to:
- receive user input through a graphical user interface (GUI)
- specifying a block diagram model, the block diagram model
- 6 including sections, a first subset of the sections designated
- 7 post-processing unit sections and a second subset of the section
- designated as core processing unit sections; and

13

1

2

3

4

6

7

generate software source code for the block diagram model
with a code generator using the second subset;
link the software source code to the first subset via an
inter-process communication link; and

compile the software source code into executable code.

35. A processor and a memory configured to:

receive user input through a graphical user interface (GUI) specifying a block diagram model, the block diagram model including sections, a first subset of the sections designated post-processing unit sections and a second subset of the section designated as core processing unit sections; and

generate software source code for the block diagram model with a code generator using the second subset;

link the software source code to the first subset via an inter-process communication link; and compile the software source code into executable code.
